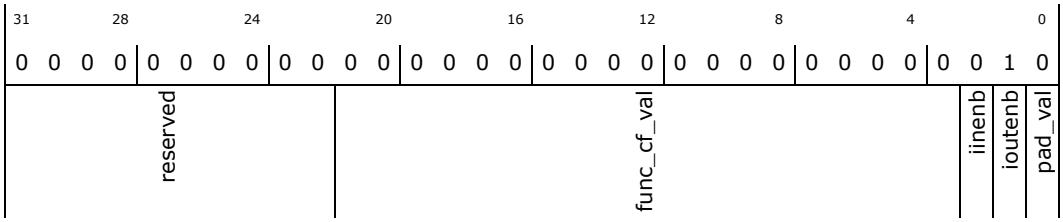
cfio_regs_pad_hv_crt_ddc_data_PAD_VAL: [IOBASE] + 4C8h

IOBASE Type: PCI Configuration Register (Size: 32 bits)
IOBASE Reference: [B:0, D:31, F:0] + 4Ch

Default: 00000002h



Bit Range	Default & Access	Description
31:22	0h RO	**Reserved (reserved):** reserved
21:3	0h RO	**Func Cf Val (func_cf_val):** c and f values for the function delay, first 15 bits are c value and 4 msb are the f value
2	0b RW	**Iinenb (iinenb):** input enable - active low
1	1b RO	**Ioutenb (ioutenb):** output enable - active low
0	0b WO	**Pad Val (pad_val):** These registers are implemented as dual read/write with dedicated storage each. This is the same register as GP_LVL for IO space. (may be overridden and inaccessible to memory region write by legacy write) - default value can be both high or low. When the register is read it is reading the pad value. When pad is written it writes the pad value only if it is output enable and it is a gpio function

3.69.1 Usb Oc1 B Pad Configuration (cfio_regs_pad_usb_oc1_b_PCONF0)—Offset 0h

PADs Memory space configuration register (Access via PCU Proxy)

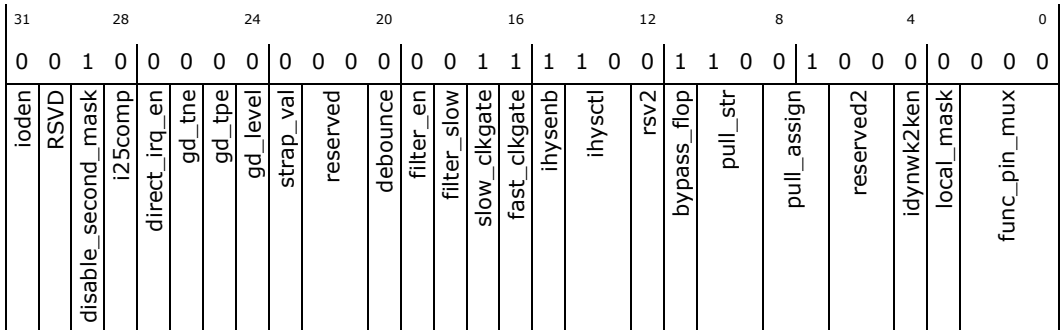
Access Method

Type: Memory Mapped I/O Register (Size: 32 bits)

cfio_regs_pad_usb_oc1_b_PCONF0: [IOBASE + 2000h] + 0h

IOBASE Type: PCI Configuration Register (Size: 32 bits)
IOBASE Reference: [B:0, D:31, F:0] + 4Ch

Default: 2003CC80h



Bit Range	Default & Access	Description
31	0b RW	**Ioden (ioden):** Open Drain enable. Active high. Voltage domain: vcccore_1p0
30	0b RO	**Reserved (RSVD):** Reserved.
29	1b RW	**Disable Second Mask (disable_second_mask):** This bit will disable second mask when PB_CONFIG all_func_mask is used. The second mask is for changing the pull and the direction of the pad in different cycles. Please refer to the GPIO HAS for details.
28	0b RO	**I25comp (i25comp):** 25 ohm compensation of hflvt buffers

Bit Range	Default & Access	Description
27	0b RW	**Direct Irq En (direct_irq_en):** If this bit is set, interrupt will used direct wire and not shared. This bit should be cleared if io access mode is selected for this pad
26	0b RW	**Gd Tne (gd_tne):** Negative edge detect for general detect event. 0 - No falling edge detect. 1 - Detect rising edge. (may be overridden and inaccessible to memory region write by legacy write). For level interrupt mode it will enable active low level irq
25	0b RW	**Gd Tpe (gd_tpe):** Positive edge detect for general detect event. 0 - No falling edge detect. 1 - Detect rising edge. (may be overridden and inaccessible to memory region write by legacy write). For level interrupt mode it will enable active high level irq
24	0b RW	**Gd Level (gd_level):** When this bit is set a level irq will be chosen and not edge irq
23	0b RO	**Strap Val (strap_val):** If strap pin exist, this bit will reflect its value even if overridden with DFT value
22:21	0h RO	**Reserved (reserved):** reserved
20	0b RO	**Debounce (debounce):** Enabling the debouncer for this pad. Debounce time will be according to the community setting at the debouce control register
19	0b RW	**Filter En (filter_en):** Enabling the glitch filter
18	0b RW	**Filter Slow (filter_slow):** Use RTC clock for unglitch filter. This bit is reserved if unglitch filter does not exist for this pad
17	1b RW	**Slow Clkgate (slow_clkgate):** 1 Enables the glitch filter slow clock
16	1b RW	**Fast Clkgate (fast_clkgate):** 1 Enables the glitch filter fast clock
15	1b RO	**Ihysenb (ihysenb):** Hysteresis enable, active low
14:13	10b RW	**Ihysctl (ihysctl):** Hysteresis control
12	0b RO	**Rsv2 (rsv2):** reserved
11	1b RO	**Bypass Flop (bypass_flop):** 1 - Bypass pad controller I/O flops (if exists) 0 - Flop enabled if exists.
10:9	10b RW	**Pull Str (pull_str):** Pull strength: 00 - 2K 01 - 10K 10 - 20K 11 - 40K
8:7	01b RW	**Pull Assign (pull_assign):** Pull assignment: 00 - Non pull 01 - Pull Up 10 - Pull down 11 - reserved
6:5	00b RO	**Reserved2 (reserved2):** reserved
4	0b RW	**Idynwk2ken (idynwk2ken):** reduce weak 2kohm pull contention current when other chip driving
3	0b RO	**Local Mask (local_mask):** reserved

Bit Range	Default & Access	Description
2:0	000b RW	**Func Pin Mux (func_pin_mux):** Func_Pin_Mux: Functional Pin Muxing Default function is always 0. These 3 bits are setting the memory function. The func_pin_mux function is masked by all_func_mask bit at the PB_CONFIG register. When IO_USE_SEL is set the pad will choose the GPIO function. function 0 is USB_OC1_B function 1 is GPIOS_20

Bit Range	Default & Access	Description
31	0b RW	**Ioden (ioden):** Open Drain enable. Active high. Voltage domain: vcccore_1p0
30	0b RO	**Reserved (RSVD):** Reserved.
29	1b RW	**Disable Second Mask (disable_second_mask):** This bit will disable second mask when PB_CONFIG all_func_mask is used. The second mask is for changing the pull and the direction of the pad in different cycles. Please refer to the GPIO HAS for details.
28	0b RO	**I25comp (i25comp):** 25 ohm compensation of hflvt buffers
27	0b RO	**Direct Irq En (direct_irq_en):** If this bit is set, interrupt will used direct wire and not shared. This bit should be cleared if io access mode is selected for this pad
26	0b RO	**Gd Tne (gd_tne):** Negative edge detect for general detect event. 0 - No falling edge detect. 1 - Detect rising edge. (may be overridden and inaccessible to memory region write by legacy write). For level interrupt mode it will enable active low level irq
25	0b RO	**Gd Tpe (gd_tpe):** Positive edge detect for general detect event. 0 - No falling edge detect. 1 - Detect rising edge. (may be overridden and inaccessible to memory region write by legacy write). For level interrupt mode it will enable active high level irq
24	0b RO	**Gd Level (gd_level):** When this bit is set a level irq will be chosen and not edge irq

Bit Range	Default & Access	Description
23	0b RO	**Strap Val (strap_val):** If strap pin exist, this bit will reflect its value even if overridden with DFT value
22:21	0h RO	**Reserved (reserved):** reserved
20	0b RO	**Debounce (debounce):** Enabling the debouncer for this pad. Debounce time will be according to the community setting at the debouce control register

Offset	Size	Register ID—Description	Default Value
FEC00000h	1	"IDX (IOAPIC_IDX)—Offset FEC00000h" on page 4012	00h
FEC00010h	4	"WDW (IOAPIC_WDW)—Offset FEC00010h" on page 4012	00000000h
FEC00040h	4	"EOI (IOAPIC_EOI)—Offset FEC00040h" on page 4013	00000000h

3.70.1 IDX (IOAPIC_IDX)—Offset FEC00000h

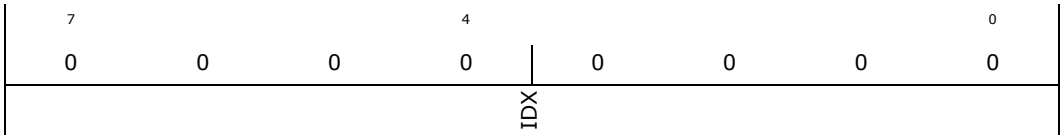
Index Register

Access Method

Type: Memory Mapped I/O Register (Size: 8 bits)

IOAPIC_IDX: FEC00000h

Default: 00h



Bit Range	Default & Access	Description
7:0	0h RW	**IDX:** This 8-bit register selects which indirect register appears in the window register to be manipulated by software. Software will program this register to select the desired APIC internal register.

3.70.2 WDW (IOAPIC_WDW)—Offset FEC00010h

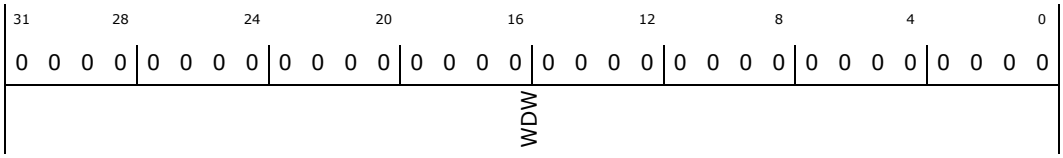
Window Register

Access Method

Type: Memory Mapped I/O Register (Size: 32 bits)

IOAPIC_WDW: FEC00010h

Default: 00000000h



Bit Range	Default & Access	Description
31:0	0h RW	**WDW:** This 32-bit register specifies the data to be read or written to the register pointed to by the IDX register. This register can be accessed only in DW quantities.

3.70.3 EOI (IOAPIC_EOI)—Offset FEC00040h

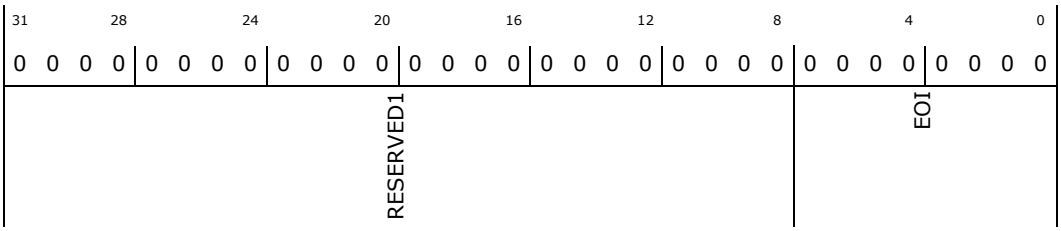
EOI Register

Access Method

Type: Memory Mapped I/O Register (Size: 32 bits)

IOAPIC_EOI: FEC00040h

Default: 00000000h



Bit Range	Default & Access	Description
31:8	0b WO	**RESERVED (RESERVED1):** Reserved.
7:0	0h WO	**EOI:** When a write is issued to this register, the IOxAPIC will check the lower 8 bits written to this register, and compare it with the vector field for each entry in the I/O Redirection Table. Master Initialization Command Word 1.A write to Initialization Command Word 1 starts the interrupt controller initialization sequence, during which the following occurs: * The Interrupt Mask register is cleared. * IRQ7 input is assigned priority 7. * The slave mode address is set to 7. * Special Mask Mode is cleared and Status Read is set to IRR. Once this write occurs, the controller expects writes to ICW2, ICW3, and ICW4 to complete the initialization sequence.

3.71.2 MICW2—Offset 21h

Master ICW2 is used to initialize the interrupt controller with the five most significant bits of the interrupt vector address. The value programmed for bits[7:3] is used by the CPU to define the base address in the interrupt vector table for the interrupt routines associated with each IRQ on the controller. Typical ISA ICW2 values are 08h for the master controller and 70h for the slave controller.

3.74.1 CAPLENGTH—Offset 0h

This register is used as an offset to add to register base to find the beginning of the Operational Register Space.

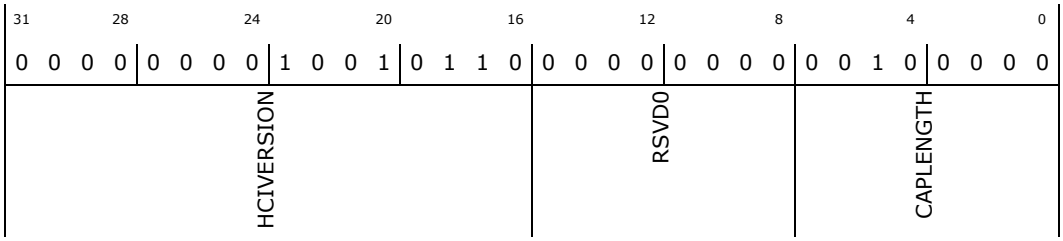
Access Method

Type: Memory Mapped I/O Register (Size: 32 bits)

CAPLENGTH: [BAR] + 0h

BAR Type: PCI Configuration Register (Size: 32 bits)
BAR Reference: [B:0, D:22, F:0] + 10h

Default: 00960020h



Bit Range	Default & Access	Description
31:16	096h RO	**HCIVERSION:** This is a two-byte register containing a BCD encoding of the xHCI specification revision number supported by this host controller. The most significant byte of this register represents a major revision and the least significant byte is the minor revision. e.g. 0100h corresponds to xHCI version 1.0.xs
15:8	0h RO	**RSVD0:** Reserved.
7:0	20h RO	**CAPLENGTH:** This register is used as an offset to add to register base to find the beginning of the Operational Register Space.

3.74.2 HCSPARAMS1—Offset 4h

number of ports implemented is 2 because there is 1 DWC_USB2_HOST_NUM_U2_ROOT_PORTS and 1 DWC_USB3_HOST_NUM_U3_ROOT_PORT

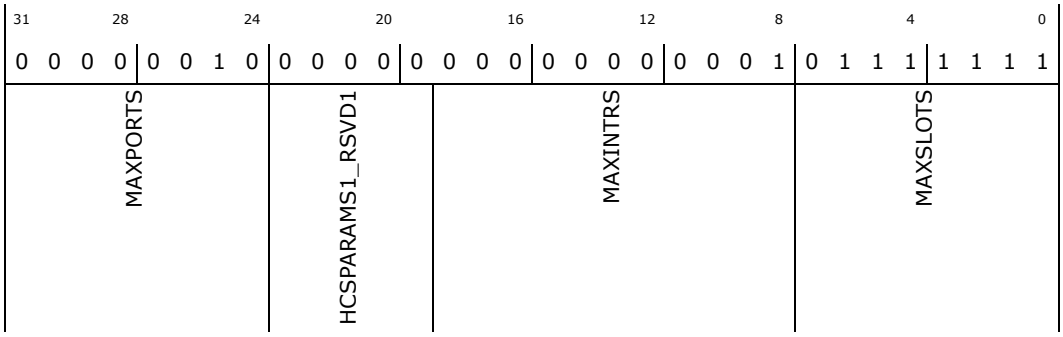
Access Method

Type: Memory Mapped I/O Register (Size: 32 bits)

HCSPARAMS1: [BAR] + 4h

BAR Type: PCI Configuration Register (Size: 32 bits)
BAR Reference: [B:0, D:22, F:0] + 10h

Default: 0200017Fh



Bit Range	Default & Access	Description
31:24	02h RO	**MAXPORTS:** Number of Ports (MaxPorts). This field specifies the maximum Port Number value, i.e. the highest numbered Port Register Set that are addressable in the Operational Register Space (refer to Table 29). Valid values are in the range of 1h to FFh. The value in this field shall reflect the maximum Port Number value assigned by an xHCI Supported Protocol Capability, described in section 7.2. Software shall refer to these capabilities to identify whether a specific Port Number is valid, and the protocol supported by the associated Port Register Set.
23:19	0h RO	**HCSPARAMS1_RSVD1:** reserved
18:8	1h RO	**MAXINTRS:** Number of Interrupters (MaxIntrs). This field specifies the number of Interrupters implemented on this host controller. Each Interrupter may be allocated to a MSI or MSI-X vector and controls its generation and moderation. The value of this field determines how many Interrupter Register Sets are addressable in the Runtime Register Space (refer to section 5.5). Valid values are in the range of 1h to 400h. A 0 in this field is undefined.
7:0	7fh RO	**MAXSLOTS:** Number of Device Slots (MaxSlots). This field specifies the maximum number of Device Context Structures and Doorbell Array entries this host controller can support. Valid values are in the range of 1 to 255. The value of 0 is reserved.

3.74.5 HCCPARAMS—Offset 10h

Capability Parameters Register

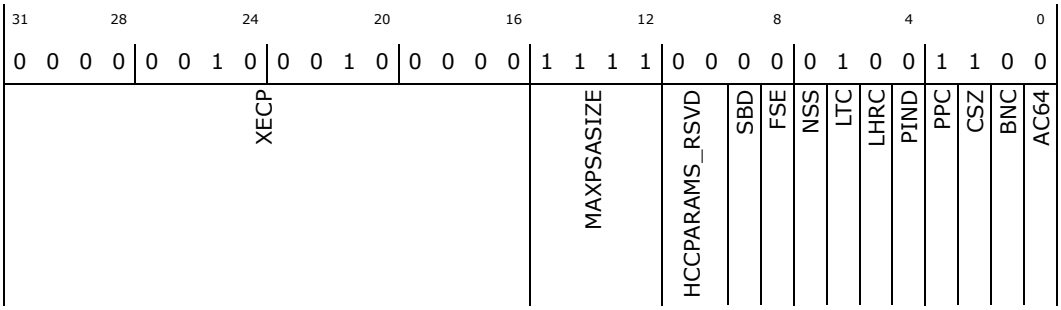
Access Method

Type: Memory Mapped I/O Register (Size: 32 bits)

HCCPARAMS: [BAR] + 10h

BAR Type: PCI Configuration Register (Size: 32 bits)
BAR Reference: [B:0, D:22, F:0] + 10h

Default: 0220F04Ch



Bit Range	Default & Access	Description
31:16	220h RO	**XECP:** Based on configuration, core automatically updates it
15:12	fh RO	**MAXPSASIZE:** Maximum Primary Stream Array Size
11:10	0h RO	**HCCPARAMS_RSVD:** Reserved
9	0h RO	**SBD:** Secondary Bandwidth Domain Reporting (SBD)
8	0h RO	**FSE:** For xHCI 0.96, this field is Force Stopped Event (FSE) / For xHCI 1.0, this field is Parse All Event Data (PAE)
7	0h RO	**NSS:** No Secondary SID Support (NSS). This flag indicates whether the host controller implementation supports Secondary Stream IDs. A 1 in this bit indicates that Secondary Stream ID decoding is not supported. A 0 in this bit indicates that Secondary Stream ID decoding is supported. (refer to Sections 4.12.2 and 6.2.3).
6	1h RO	**LTC:** Latency Tolerance Messaging Capability (LTC). This flag indicates whether the host controller implementation supports Latency Tolerance Messaging (LTM). A 1 in this bit indicates that LTM is supported. A 0 in this bit indicates that LTM is not supported. Refer to section 4.13.1 for more information on LTM.
5	0h RO	**LHRC:** Light HC Reset Capability (LHRC). This flag indicates whether the host controller implementation supports a Light Host Controller Reset. A 1 in this bit indicates that Light Host Controller Reset is supported. A 0 in this bit indicates that Light Host Controller Reset is not supported. The value of this flag affects the functionality of the Light Host Controller Reset (LHCRST) flag in the USBCMD register (refer to Section 5.4.1).

Bit Range	Default & Access	Description
4	0h RO	**PIND:** Port Indicators (PIND). This bit indicates whether the xHC root hub ports support port indicator control. When this bit is a 1, the port status and control registers include a read/writeable field for controlling the state of the port indicator. Refer to Section 5.4.8 for definition of the Port Indicator Control field.
3	1h RO	**PPC:** Port Power Control (PPC). This flag indicates whether the host controller implementation includes port power control. A 1 in this bit indicates the ports have port power switches. A 0 in this bit indicates the port do not have port power switches. The value of this flag affects the functionality of the PP flag in each port status and control register (refer to Section 5.4.8).
2	1h RO	**CSZ:** Context Size (CSZ). If this bit is set to 1, then the xHC uses 64 byte Context data structures. If this bit is cleared to 0, then the xHC uses 32 byte Context data structures. Note: This flag does not apply to Stream Contexts.
1	0h RO	**BNC:** BW Negotiation Capability (BNC). This flag identifies whether the xHC has implemented the Bandwidth Negotiation. Values for this flag have the following interpretation: for Value 0 Description BW Negotiation not implemented. for Value 1 DescriptionBW Negotiation implemented. Refer to section 4.16 of XHCI specification for more information on Bandwidth Negotiation.
0	0h RO	**AC64:** 64-bit Addressing Capability (AC64). This flag documents the addressing range capability of this implementation. The value of this flag determines whether the xHC has implemented the high order 32 bits of 64 bit register and data structure pointer fields. Values for this flag have the following interpretation: for Value 0 Description 32-bit address memory pointers implemented. for Value 1 description 64-bit address memory pointers implemented. If 32-bit address memory pointers are implemented, the xHC shall ignore the high order 32 bits of 64 bit data structure pointer fields, and system software shall ignore the high order 32 bits of 64 bit xHC registers.

3.74.9 USBCMD—Offset 20h

USB Command Register Bit Definitions

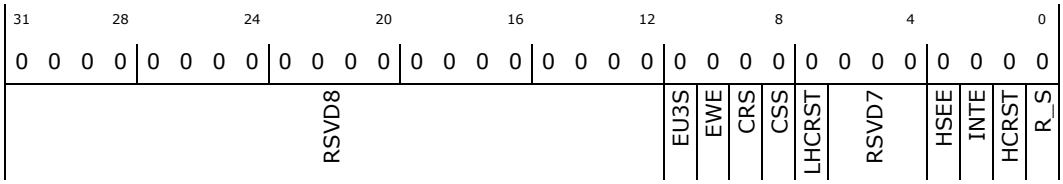
Access Method

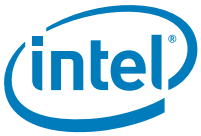
Type: Memory Mapped I/O Register (Size: 32 bits)

USBCMD: [BAR] + 20h

BAR Type: PCI Configuration Register (Size: 32 bits)
BAR Reference: [B:0, D:22, F:0] + 10h

Default: 00000000h





Bit Range	Default & Access	Description
31:12	0h RO	**RSVD8:** reserved
11	0h RW	**EU3S:** Enable U3 MFINDEX Stop (EU3S) - RW. Default = 0. When set to 1, the xHC may stop the MFINDEX counting action if all Root Hub ports are in the U3, Disconnected, Disabled, or Powered-off state. When cleared to 0 the xHC may stop the MFINDEX counting action if all Root Hub ports are in the Disconnected, Disabled, Training, or Powered-off state. Refer to section 4.14.2 for more information.
10	0h RW	**EWE:** Enable Wrap Event (EWE) - RW. Default = 0. When set to 1, the xHC shall generate a MFINDEX Wrap Event every time the MFINDEX register transitions from 03FFFh to 0. When cleared to 0 no MFINDEX Wrap Events are generated. Refer to section 4.14.2 for more information. When this register is exposed by a Virtual Function (VF), the generation of MFINDEX Wrap Events to VFs shall be emulated by the VMM.
9	0h RW	**CRS:** Controller Restore State: This command is similar to the USBCMD. CRS bit in host mode and initiates the restore process. When software sets this bit to '1', the controller immediately sets DSTS.RSS to '1'. When the controller has finished the restore process, it sets DSTS.RSS to '0'.
8	0h RW	**CSS:** Controller Save State: This command is similar to the USBCMD. CSS bit in host mode and initiates the save process. When software sets this bit to '1', the controller immediately sets DSTS.SSS to '1'. When the controller has finished the save process, it sets DSTS.SSS to '0'.
7	0h RW	**LHCRST:** Light Host Controller Reset (LHCRST) RO or RW. Optional normative. Default = 0. If the Light HC Reset Capability (LHRC) bit in the HCCPARAMS register is 1, then this flag allows the driver to reset the xHC without affecting the state of the ports. A system software read of this bit as 0 indicates the Light Host Controller Reset has completed and it is safe for software to re-initialize the xHC. A software read of this bit as a 1 indicates the Light Host Controller Reset has not yet completed. If not implemented, a read of this flag shall always return a 0. All registers in the Aux Power well shall maintain the values that had been asserted prior to the Light Host Controller Reset. Refer to section 4.23.1 for more information. When this register is exposed by a Virtual Function (VF), this bit only generates a Light Reset to the xHC instance presented by the selected VF, e.g. Disable the VFs device slots and set the associated VF Run bit to Stopped. Refer to section 8 for more information.
6:4	0h RO	**RSVD7:** Reserved
3	0h RW	**HSEE:** Host System Error Enable (HSEE) RW. Default = 0. When this bit is a 1, and the HSE bit in the USBSTS register is a 1, the xHC shall assert out-of-band error signaling to the host. The signaling is acknowledged by software clearing the HSE bit. Refer to section 4.10.2.6 for more information. When this register is exposed by a Virtual Function (VF), the effect of the assertion of this bit on the Physical Function (PF0) is determined by the VMM. Refer to section 8 for more information.

Bit Range	Default & Access	Description
2	0h RW	**INTE:** Interrupter Enable (INTE) RW. Default = 0. This bit provides system software with a means of enabling or disabling the host system interrupts generated by Interrupters. When this bit is a 1, then Interrupter host system interrupt generation is allowed, e.g. the xHC shall issue an interrupt at the next interrupt threshold if the host system interrupt mechanism (e.g. MSI, MSI-X, etc.) is enabled. The interrupt is acknowledged by a host system interrupt specific mechanism. When this register is exposed by a Virtual Function (VF), this bit only enables the set of Interrupters assigned to the selected VF. Refer to section 7.7.2 for more information.
1	0h RW	**HCRST:** Host Controller Reset (HCRST) RW. Default = 0. This control bit is used by software to reset the host controller. The effects of this bit on the xHC and the Root Hub registers are similar to a Chip Hardware Reset. When software writes a 1 to this bit, the Host Controller resets its internal pipelines, timers, counters, state machines, etc. to their initial value. Any transaction currently in progress on the USB is immediately terminated. A USB reset shall not be driven on USB2 downstream ports, however a Hot or Warm Reset shall be initiated on USB3 Root Hub downstream ports. PCI Configuration registers are not affected by this reset. All operational registers, including port registers and port state machines are set to their initial values. Software shall re initialize the host controller as described in Section 4.1 in order to return the host controller to an operational state. This bit is cleared to 0 by the Host Controller when the reset process is complete. Software cannot terminate the reset process early by writing a 0 to this bit and shall not write any xHC Operational or Runtime registers until while HCRST is 1. Note, the completion of the xHC reset process is not gated by the Root Hub port reset process. Software shall not set this bit to 1 when the HCHalted (HCH) bit in the USBSTS register is a 0. Attempting to reset an actively running host controller may result in undefined behavior. When this register is exposed by a Virtual Function (VF), this bit only resets the xHC instance presented by the selected VF. Refer to section 8 for more information.
0	0h RW	**R_S:** Run/Stop (R/S) RW. Default = 0. 1 = Run. 0 = Stop. When set to a 1, the xHC proceeds with execution of the schedule. The xHC continues execution as long as this bit is set to a 1. When this bit is cleared to 0, the xHC completes any current or queued commands or TDs, and any USB transactions associated with them, then halts. Refer to section 5.4.1.1 for more information on how R/S shall be managed. The xHC shall halt within 16 ms. after software clears the Run/Stop bit if the above conditions have been met. The HCHalted (HCH) bit in the USBSTS register indicates when the xHC has finished its pending pipelined transactions and has entered the stopped state. Software shall not write a 1 to this flag unless the xHC is in the Halted state (i.e. HCH in the USBSTS register is 1). Doing so may yield undefined results. Writing a 0 to this flag when the xHC is in the Running state (i.e. HCH = 0) and any Event Rings are in the Event Ring Full state (refer to section 4.9.4) may result in lost events. When this register is exposed by a Virtual Function (VF), this bit only controls the run state of the xHC instance presented by the selected VF. Refer to section 8 for more information.

12	0h RO	**HCE:** Host Controller Error (HCE) - RO. Default = 0. 0' = No internal xHC error conditions exist '1' = Internal xHC error condition. This flag shall be set to indicate that an internal error condition has been detected which requires software to reset and reinitialize the xHC. Refer to section 4.24.1 of xhci specification for more information.
11	0h RO	**CNR:** Controller Not Ready (CNR) - RO. Default = '1'. '0' = Ready '1' = Not Ready. Software shall not write any Doorbell or Operational register of the xHC, other than the USBSTS register, until CNR = '0'. This flag is set by the xHC after a Chip Hardware Reset and cleared when the xHC is ready to begin accepting register writes. This flag shall remain cleared ('0') until the next Chip Hardware Reset.
10	0h RO	**SRE:** Save/Restore Error (SRE) -RW1C. Default = '0'. If an error occurs during a Save or Restore operation this bit shall be set to '1'. This bit shall be cleared to '0' when a Save or Restore operation is initiated or when written with '1'. Refer to section 4.23.2 of xhci specification for more information.
9	0h RO	**RSS:** Restore State Status: This bit is similar to the USBSTS.RSS in host mode. When the controller has finished the save process, it will complete the command by setting DSTS.RSS to '0'.
8	0h RO	**SSS:** Save State Status: This bit is similar to the USBSTS.SSS in host mode. When the controller has finished the save process, it will complete the command by setting DSTS.SSS to '0'

3.74.11 PAGESIZE—Offset 28h

Page Size Register Bit Definitions. This register is used by software to enable or disable the reporting of the reception of specific USB Device Notification Transaction Packets. A Notification Enable (Nx, where x = 0 to 15) flag is defined for each of the 16 possible device notification types. If a flag is set for a specific notification type, a Device Notification Event shall be generated when the respective notification packet is received. After reset all notifications are disabled. Refer to section 6.4.2.7. This register shall be written as a Dword. Byte writes produce undefined results.

Bit Range	Default & Access	Description
31:6	0h RW	**CMD_RING_PNTR:** Command Ring Pointer - RW. Default = 0. This field defines high order bits of the initial value of the 64-bit Command Ring Dequeue Pointer. Writes to this field are ignored when Command Ring Running (CRR) = 1. If the CRCR is written while the Command Ring is stopped (CCR = 0), the value of this field shall be used to fetch the first Command TRB the next time the Host Controller Doorbell register is written with the DB Reason field set to Host Controller Command. If the CRCR is not written while the Command Ring is stopped (CCR = 0) then the Command Ring shall begin fetching Command TRBs at the current value of the internal xHC Command Ring Dequeue Pointer. Reading this field always returns 0.
5:4	0h RO	**RSVD14:** reserved
3	0h RW	**CRR:** Command Ring Running (CRR) - RO. Default = 0. This flag is set to 1 if the Run/Stop (R/S) bit is 1 and the Host Controller Doorbell register is written with the DB Reason field set to Host Controller Command. It is cleared to 0 when the Command Ring is stopped after writing a 1 to the Command Stop (CS) or Command Abort (CA) flags, or if the R/S bit is cleared to 0.

Bit Range	Default & Access	Description
2	0h RW	**CA:** Command Abort (CA) - RW1S. Default = 0. Writing a 1 to this bit shall immediately terminate the currently executing command, stop the Command Ring, and generate a Command Completion Event with the Completion Code set to Command Ring Stopped. Refer to section 4.6.1.2 for more information on aborting a command. The next write to the Host Controller Doorbell with DB Reason field set to Host Controller Command shall restart the Command Ring operation. Writes to this flag are ignored by the xHC if Command Ring Running (CRR) = 0. Reading this bit always returns 0.
1	0h RW	**CS:** Command Stop (CS) - RW1S. Default = 0. Writing a 1 to this bit shall stop the operation of the Command Ring after the completion of the currently executing command, and generate a Command Completion Event with the Completion Code set to Command Ring Stopped and the Command TRB Pointer set to the current value of the Command Ring Dequeue Pointer. Refer to section 4.6.1.1 for more information on stopping a command. The next write to the Host Controller Doorbell with DB Reason field set to Host Controller Command shall restart the Command Ring operation. Writes to this flag are ignored by the xHC if Command Ring Running (CRR) = 0. Reading this bit shall always return 0.
0	0h RW	**RCS:** Ring Cycle State (RCS) - RW. This bit identifies the value of the xHC Consumer Cycle State (CCS) flag for the TRB referenced by the Command Ring Pointer. Refer to section 4.9.3 for more information. Writes to this flag are ignored if Command Ring Running (CRR) is 1. If the CRCR is written while the Command Ring is stopped (CRR = 0), then the value of this flag shall be used to fetch the first Command TRB the next time the Host Controller Doorbell register is written with the DB Reason field set to Host Controller Command. If the CRCR is not written while the Command Ring is stopped (CRR = 0), then the Command Ring shall begin fetching Command TRBs using the current value of the internal Command Ring CCS flag. Reading this flag always returns 0.

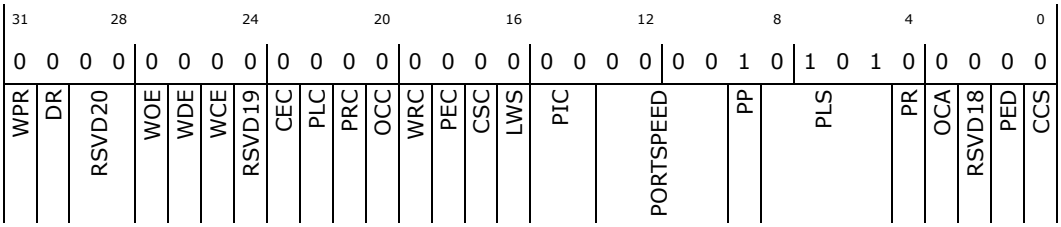
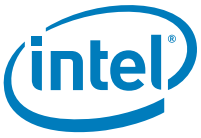
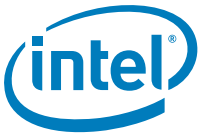
Default: 000002A0h



Bit Range	Default & Access	Description
31	0h RW	**WPR:** Warm Port Reset (WPR) RW1S/RsvdZ. Default = 0. When software writes a 1 to this bit, the Warm Reset sequence as defined in the USB3 Specification is initiated and the PR flag is set to 1. Once initiated, the PR, PRC, and WRC flags shall reflect the progress of the Warm Reset sequence. This flag shall always return 0 when read. Refer to section 4.19.5.1. of XHCI specification. This flag only applies to USB3 protocol ports. For USB2 protocol ports it shall be RsvdZ.
30	0h RW	**DR:** Device Removable (DR) - RO. This flag indicates if this port has a removable device attached. 1 = Device is non-removable. 0 = Device is removable.
29:28	0h RO	**RSVD20:** reserved
27	0h RW	**WOE:** Wake on Over-current Enable (WOE) RWS. Default = 0. Writing this bit to a 1 enables the port to be sensitive to over-current conditions as system wake-up events. Refer to section 4.15 for operational model.
26	0h RW	**WDE:** Wake on Disconnect Enable (WDE) RWS. Default = 0. Writing this bit to a 1 enables the port to be sensitive to device disconnects as system wake-up eventsn. Refer to section 4.15 for operational model.
25	0h RW	**WCE:** Wake on Connect Enable (WCE) RWS. Default = 0. Writing this bit to a 1 enables the port to be sensitive to device connects as system wake-up events . Refer to section 4.15 for operational model.
24	0h RO	**RSVD19:** reserved
23	0h RW	**CEC:** Port Config Error Change (CEC) RW1CS/RsvdZ. Default = 0. This flag indicates that the port failed to configure its link partner. 0 = No change. 1 = Port Config Error detected. Software shall clear this bit by writing a '1' to it. Refer to section 4.19.2 for more information on change bit usage. Note: This flag is valid only for USB3 protocol ports. For USB2 protocol ports this bit shall be RsvdZ.
22	0h RW	**PLC:** Port Link State Change (PLC) RW1CS. Default = 0. This flag is set to 1 due to the following PLS transitions mentioned in the XHCI specification



Bit Range	Default & Access	Description
21	0h RW	**PRC:** Port Reset Change (PRC) RW1CS. Default = 0. This flag is set to 1 due to a '1' to '0' transition of Port Reset (PR). e.g. when any reset processing (Warm or Hot) on this port is complete. Note that this flag shall not be set to 1 if the reset processing was forced to terminate due to software clearing PP or PED to '0'. 0 = No change. 1 = Reset complete. Software shall clear this bit by writing a '1' to it. Refer to section 4.19.5. Refer to section 4.19.2 for more information on change bit usage.
20	0h RW	**OCC:** Over-current Change (OCC) RW1CS. Default = 0. This bit shall be set to a 1 when there is a 0 to 1 or 1 to 0 transition of Over-current Active (OCA). Software shall clear this bit by writing a 1 to it. Refer to section 4.19.2 for more information on change bit usage.
19	0h RW	**WRC:** Warm Port Reset Change (WRC) RW1CS/RsvdZ. Default = 0. This bit is set when Warm Reset processing on this port completes. 0 = No change. 1 = Warm Reset complete. Note that this flag shall not be set to 1 if the Warm Reset processing was forced to terminate due to software clearing PP or PED to '0'. Software shall clear this bit by writing a '1' to it. Refer to section 4.19.5.1. Refer to section 4.19.2 for more information on change bit usage. This bit only applies to USB3 protocol ports. For USB2 protocol ports it shall be RsvdZ.
18	0h RW	**PEC:** Port Enabled/Disabled Change (PEC) RW1CS. Default = 0. 1 = change in PED. 0 = No change. Note that this flag shall not be set if the PED transition was due to software setting PP to 0. Software shall clear this bit by writing a 1 to it. Refer to section 4.19.2 for more information on change bit usage. For a USB2 protocol port, this bit shall be set to 1 only when the port is disabled due to the appropriate conditions existing at the EOF2 point (refer to section 11.8.1 of the USB2 Specification for the definition of a Port Error). For a USB3 protocol port, this bit shall never be set to 1.
17	0h RW	**CSC:** Connect Status Change (CSC) RW1CS. Default = 0. 1 = Change in CCS. 0 = No change. This flag indicates a change has occurred in the ports Current Connect Status (CCS) or Cold Attach Status (CAS) bits. Note that this flag shall not be set if the CCS transition was due to software setting PP to 0, or the CAS transition was due to software setting WPR to 1. The xHC sets this bit to 1 for all changes to the port device connect status , even if system software has not cleared an existing Connect Status Change. For example, the insertion status changes twice before system software has cleared the changed condition, root hub hardware will be setting an already-set bit (i.e., the bit will remain 1). Software shall clear this bit by writing a 1 to it. Refer to section 4.19.2 for more information on change bit usage.
16	0h RW	**LWS:** Port Link State Write Strobe (LWS) RW. Default = 0. When this bit is set to 1 on a write reference to this register, this flag enables writes to the PLS field. When 0, write data in PLS field is ignored. Reads to this bit return 0.
15:14	0h RW	**PIC:** Port Indicator Control (PIC) RWS. Default = 0. Writing to these bits has no effect if the Port Indicators (PIND) bit in the HCCPARAMS register is a 0.
13:10	0h RW	**PORTSPEED:** Port Speed (Port Speed) ROS. Default = 0. This field identifies the speed of the connected USB Device. This field is only relevant if a device is connected (CCS = 1) in all other cases this field shall indicate Undefined Speed. (more information in the XHCI specification)



Bit Range	Default & Access	Description
9	1h RW	**PP:** Port Power (PP) RWS. Default = 1. This flag reflects a port's logical, power control state. Because host controllers can implement different methods of port power switching, this flag may or may not represent whether (VBus) power is actually applied to the port. When PP equals a '0' the port is nonfunctional and shall not report attaches, detaches, or Port Link State (PLS) changes. However, the port shall report over-current conditions when PP = 0 if PPC = 0. After modifying PP, software shall read PP and confirm that it is reached its target state before modifying it again , undefined behavior may occur if this procedure is not followed. 0 = This port is in the Powered-off state. 1 = This port is not in the Powered-off state. If the Port Power Control (PPC) flag in the HCCPARAMS register is '1', then xHC has port power control switches and this bit represents the current setting of the switch ('0' = off, '1' = on). If the Port Power Control (PPC) flag in the HCCPARAMS register is '0', then xHC does not have port power control switches and each port is hard wired to power, and not affected by this bit. When an over-current condition is detected on a powered port, the xHC shall transition the PP bit in each affected port from a 1 to 0 (removing power from the port). Note: If this is an SSIC Port, then the DSP Disconnect process is initiated by '1' to '0' transition of PP. Refer to section 5.1.2 in the SSIC Spec for more information. Refer to section 4.19.4 for more information.
8:5	5h RW	**PLS:** Port Link State (PLS) RWS. Default = RxDetect (5). This field is used to power manage the port and reflects its current link state. When the port is in the Enabled state, system software may set the link U state by writing this field. System software may also write this field to force a Disabled to Disconnected state transition of the port.
4	0h RW	**PR:** Port Reset (PR) RW1S. Default = 0. 1 = Port Reset signaling is asserted. 0 = Port is not in Reset. When software writes a 1 to this bit generating a 0 to 1 transition, the bus reset sequence is initiated ; USB2 protocol ports shall execute the bus reset sequence as defined in the USB2 Spec. USB3 protocol ports shall execute the Hot Reset sequence as defined in the USB3 Spec. PR remains set until reset signaling is completed by the root hub. Note that software shall write a 1 to this flag to transition a USB2 port from the Polling state to the Enabled state. Refer to sections 4.15.2.3 and 4.19.1.1. This flag is 0 if PP is 0.
3	0h RW	**OCA:** Over-current Active (OCA) RO. Default = 0. 1 = This port currently has an over-current condition. 0 = This port does not have an over-current condition. This bit shall automatically transition from a 1 to a 0 when the over-current condition is removed.
2	0h RO	**RSVD18:** reserved

Bit Range	Default & Access	Description
1	0h RW	**PED:** Port Enabled/Disabled (PED) RW1CS. Default = 0. 1 = Enabled. 0 = Disabled. Ports may only be enabled by the xHC. Software cannot enable a port by writing a 1 to this flag. A port may be disabled by software writing a 1 to this flag. This flag shall automatically be cleared to 0 by a disconnect event or other fault condition. Note that the bit status does not change until the port state actually changes. There may be a delay in disabling or enabling a port due to other host controller or bus events. When the port is disabled (PED = 0) downstream propagation of data is blocked on this port, except for reset. For USB2 protocol ports: When the port is in the Disabled state, software shall reset the port (PR = 1) to transition PED to 1 and the port to the Enabled state. For USB3 protocol ports: When the port is in the Polling state (after detecting an attach), the port shall automatically transition to the Enabled state and set PED to 1 upon the completion of successful link training. When the port is in the Disabled state, software shall write a 5 (RxDetect) to the PLS field to transition the port to the Disconnected state. Refer to section 4.19.1.2. PED shall automatically be cleared to 0 when PR is set to 1, and set to 1 when PR transitions from 1 to 0 after a successful reset. Refer to Port Reset (PR) bit for more information on how the PED bit is managed. Note that when software writes this bit to a 1, it shall also write a 0 to the PR bit . This flag is 0 if PP is 0.
0	0h RW	**CCS:** Current Connect Status (CCS) ROS. Default = 0. 1 = A device is connected to the port. 0 = A device is not connected. This value reflects the current state of the port, and may not correspond directly to the event that caused the Connect Status Change (CSC) bit to be set to 1. Refer to sections 4.19.3 and 4.19.4 for more details on the Connect Status Change (CSC) assertion conditions. This flag is 0 if PP is 0.

15:8	0h RW	**L1DS:** Reg field L1DSLOT
7:4	0h RW	**HIRD:** Host Initiated Resume Duration (HIRD) - RW. Default = '0'. System software sets this field to indicate to the recipient device how long the xHC will drive resume if it (the xHC) initiates an exit from L1. The HIRD value is encoded as follows: Value Description 0h 50 s. (default) 1h 125 s. 2h 200 s. Fh 1.175 ms. The value of 0000b is interpreted as 50 s. Each incrementing value up adds 75 s. to the previous value. For example, 0001b is 125 s, 0010b is 200s and so on. Based on this rule, the maximum value resume drive time is at encoding value 1111b which represents 1.2ms. Note that the HIRD field is used by both software and hardware controlled LPM. Refer to section 4.23.5.1.1 of xhci specification for more information on HIRD use. Refer to Section 4.1 of the USB2 LPM spec for more information on the use of the HIRD field.
3	0h RW	**RWE:** Port Test Control
2:0	0h RO	**L1S:** L1 Status (L1S) - RO. Default = 0. This field is used by software to determine whether an L1based suspend request (LMP transaction) was successful, specifically: Value Meaning 0 Invalid - This field shall be ignored by software. 1 Success - Port successfully transitioned to L1 (ACK) 2 Not Yet - Device is unable to enter L1 at this time (NYET) 3 Not Supported -Device does not support L1 transitions (STALL) 4 Timeout/Error -Device failed to respond to the LPM Transaction or an error occurred 5-7 Reserved The value of this field is only valid when the port resides in the L0 or L1 state (PLS = '0' or '2'). Refer to section 4.23.5.1.1 for more information.

9:2	0h RW	**L1TIMEOUT:** L1 Timeout RWS. Default = 00h. Timeout value for the L1 inactivity timer (LPM Timer). This field shall be set to 00h by the assertion of PR to 1. Refer to section 4.23.5.1.1.1 for more information on L1 Timeout operation. The following are permissible values: for 00h 128 s. (default). for 01h 256 s. for 02h 512 s. for 03h 768 s. . . . for FFh 65,280 s.
1:0	0h RW	**HIRDM:** Host Initiated Resume Duration Mode (HIRDM) - RWS. Default = 0h. Indicates which HIRD value should be used. The following are permissible values: for 0 Initiate L1 using BESL only on timeout. (default). for 1 Initiate L1 using BESLD on timeout. If rejected by device, initiate L1 using BESL. for 3-2 Reserved.

3.74.22 PORTSC2—Offset 430h

A host controller shall implement one or more port registers. The number of port registers implemented by a particular instantiation of a host controller is documented in the HCSPARAMS1 register (Section 5.3.3). Software uses this information as an input parameter to determine how many ports need to be serviced

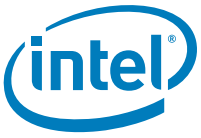
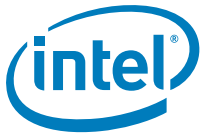
Bit Range	Default & Access	Description
31	0h RW	**WPR:** Warm Port Reset (WPR) RW1S/RsvdZ. Default = 0. When software writes a 1 to this bit, the Warm Reset sequence as defined in the USB3 Specification is initiated and the PR flag is set to 1. Once initiated, the PR, PRC, and WRC flags shall reflect the progress of the Warm Reset sequence. This flag shall always return 0 when read. Refer to section 4.19.5.1. This flag only applies to USB3 protocol ports. For USB2 protocol ports it shall be RsvdZ.
30	0h RW	**DR:** Device Removable (DR) - RO. This flag indicates if this port has a removable device attached. 1 = Device is non-removable. 0 = Device is removable.
29:28	0h RO	**RSVD25:** reserved



Bit Range	Default & Access	Description
27	0h RW	**WOE:** Wake on Over-current Enable (WOE) RWS. Default = 0. Writing this bit to a 1 enables the port to be sensitive to over-current conditions as system wake-up eventsn. Refer to section 4.15 for operational model.
26	0h RW	**WDE:** Wake on Disconnect Enable (WDE) RWS. Default = 0. Writing this bit to a 1 enables the port to be sensitive to device disconnects as system wake-up eventsn. Refer to section 4.15 for operational model.
25	0h RW	**WCE:** Wake on Connect Enable (WCE) RWS. Default = 0. Writing this bit to a 1 enables the port to be sensitive to device connects as system wake-up events . Refer to section 4.15 for operational model.
24	0h RO	**RSVD24:** reserved
23	0h RW	**CEC:** Port Config Error Change (CEC) RW1CS/RsvdZ. Default = 0. This flag indicates that the port failed to configure its link partner. 0 = No change. 1 = Port Config Error detected. Software shall clear this bit by writing a '1' to it. Refer to section 4.19.2 of XHCI specification for more information on change bit usage. Note: This flag is valid only for USB3 protocol ports. For USB2 protocol ports this bit shall be RsvdZ.
22	0h RW	**PLC:** Port Link State Change (PLC) RW1CS. Default = 0. This flag is set to 1 due to the PLS transitions in the XHCI specification
21	0h RW	**PRC:** Port Reset Change (PRC) RW1CS. Default = 0. This flag is set to 1 due to a '1' to '0' transition of Port Reset (PR). e.g. when any reset processing (Warm or Hot) on this port is complete. Note that this flag shall not be set to 1 if the reset processing was forced to terminate due to software clearing PP or PED to '0'. 0 = No change. 1 = Reset complete. Software shall clear this bit by writing a '1' to it. Refer to section 4.19.5.of XHCI specification. Refer to section 4.19.2 of XHCI specification. for more information on change bit usage.
20	0h RW	**OCC:** Over-current Change (OCC) RW1CS. Default = 0. This bit shall be set to a 1 when there is a 0 to 1 or 1 to 0 transition of Over-current Active (OCA). Software shall clear this bit by writing a 1 to it. Refer to section 4.19.2 for more information on change bit usage.
19	0h RW	**WRC:** Warm Port Reset Change (WRC) RW1CS/RsvdZ. Default = 0. This bit is set when Warm Reset processing on this port completes. 0 = No change. 1 = Warm Reset complete. Note that this flag shall not be set to 1 if the Warm Reset processing was forced to terminate due to software clearing PP or PED to '0'. Software shall clear this bit by writing a '1' to it. Refer to section 4.19.5.1. Refer to section 4.19.2 for more information on change bit usage. This bit only applies to USB3 protocol ports. For USB2 protocol ports it shall be RsvdZ.
18	0h RW	**PEC:** Port Enabled/Disabled Change (PEC) RW1CS. Default = 0. 1 = change in PED. 0 = No change. Note that this flag shall not be set if the PED transition was due to software setting PP to 0. Software shall clear this bit by writing a 1 to it. Refer to section 4.19.2 for more information on change bit usage. For a USB2 protocol port, this bit shall be set to 1 only when the port is disabled due to the appropriate conditions existing at the EOF2 point (refer to section 11.8.1 of the USB2 Specification for the definition of a Port Error). For a USB3 protocol port, this bit shall never be set to 1.



Bit Range	Default & Access	Description
17	0h RW	**CSC:** Connect Status Change (CSC) RW1CS. Default = 0. 1 = Change in CCS. 0 = No change. This flag indicates a change has occurred in the ports Current Connect Status (CCS) or Cold Attach Status (CAS) bits. Note that this flag shall not be set if the CCS transition was due to software setting PP to 0, or the CAS transition was due to software setting WPR to 1. The xHC sets this bit to 1 for all changes to the port device connect status , even if system software has not cleared an existing Connect Status Change. For example, the insertion status changes twice before system software has cleared the changed condition, root hub hardware will be setting an already-set bit (i.e., the bit will remain 1). Software shall clear this bit by writing a 1 to it. Refer to section 4.19.2 for more information on change bit usage.
16	0h RW	**LWS:** Port Link State Write Strobe (LWS) RW. Default = 0. When this bit is set to 1 on a write reference to this register, this flag enables writes to the PLS field. When 0, write data in PLS field is ignored. Reads to this bit return 0.
15:14	0h RW	**PIC:** Port Indicator Control (PIC) RWS. Default = 0. Writing to these bits has no effect if the Port Indicators (PIND) bit in the HCCPARAMS register is a 0
13:10	0h RW	**PORTSPEED:** Port Speed (Port Speed) ROS. Default = 0. This field identifies the speed of the connected USB Device. This field is only relevant if a device is connected (CCS = 1) in all other cases this field shall indicate Undefined Speed.
9	1h RW	**PP:** Port Power (PP) RWS. Default = 1. This flag reflects a port's logical, power control state. Because host controllers can implement different methods of port power switching, this flag may or may not represent whether (VBus) power is actually applied to the port. When PP equals a '0' the port is nonfunctional and shall not report attaches, detaches, or Port Link State (PLS) changes. However, the port shall report over-current conditions when PP = 0 if PPC = 0. After modifying PP, software shall read PP and confirm that it is reached its target state before modifying it again , undefined behavior may occur if this procedure is not followed. 0 = This port is in the Powered-off state. 1 = This port is not in the Powered-off state. If the Port Power Control (PPC) flag in the HCCPARAMS register is '1', then xHC has port power control switches and this bit represents the current setting of the switch ('0' = off, '1' = on). If the Port Power Control (PPC) flag in the HCCPARAMS register is '0', then xHC does not have port power control switches and each port is hard wired to power, and not affected by this bit. When an over-current condition is detected on a powered port, the xHC shall transition the PP bit in each affected port from a 1 to 0 (removing power from the port). Note: If this is an SSIC Port, then the DSP Disconnect process is initiated by '1' to '0' transition of PP. Refer to section 5.1.2 in the SSIC Spec for more information. Refer to section 4.19.4 for more information.
8:5	5h RW	**PLS:** Port Link State (PLS) RWS. Default = RxDetect (5). This field is used to power manage the port and reflects its current link state. When the port is in the Enabled state, system software may set the link U state by writing this field. System software may also write this field to force a Disabled to Disconnected state transition of the port.

Bit Range	Default & Access	Description
4	0h RW	**PR:** Port Reset (PR) RW1S. Default = 0. 1 = Port Reset signaling is asserted. 0 = Port is not in Reset. When software writes a 1 to this bit generating a 0 to 1 transition, the bus reset sequence is initiated ; USB2 protocol ports shall execute the bus reset sequence as defined in the USB2 Spec. USB3 protocol ports shall execute the Hot Reset sequence as defined in the USB3 Spec. PR remains set until reset signaling is completed by the root hub. Note that software shall write a 1 to this flag to transition a USB2 port from the Polling state to the Enabled state. Refer to sections 4.15.2.3 and 4.19.1.1. of XHCI specification. This flag is 0 if PP is 0.
3	0h RW	**OCA:** Over-current Active (OCA) RO. Default = 0. 1 = This port currently has an over-current condition. 0 = This port does not have an over-current condition. This bit shall automatically transition from a 1 to a 0 when the over-current condition is removed.
2	0h RO	**RSVD23:** reserved
1	0h RW	**PED:** Port Enabled/Disabled (PED) RW1CS. Default = 0. 1 = Enabled. 0 = Disabled. Ports may only be enabled by the xHC. Software cannot enable a port by writing a 1 to this flag. A port may be disabled by software writing a 1 to this flag. This flag shall automatically be cleared to 0 by a disconnect event or other fault condition. Note that the bit status does not change until the port state actually changes. There may be a delay in disabling or enabling a port due to other host controller or bus events. When the port is disabled (PED = 0) downstream propagation of data is blocked on this port, except for reset. For USB2 protocol ports: When the port is in the Disabled state, software shall reset the port (PR = 1) to transition PED to 1 and the port to the Enabled state. For USB3 protocol ports: When the port is in the Polling state (after detecting an attach), the port shall automatically transition to the Enabled state and set PED to 1 upon the completion of successful link training. When the port is in the Disabled state, software shall write a 5 (RxDetect) to the PLS field to transition the port to the Disconnected state. Refer to section 4.19.1.2. of xhci specification. PED shall automatically be cleared to 0 when PR is set to 1, and set to 1 when PR transitions from 1 to 0 after a successful reset. Refer to Port Reset (PR) bit for more information on how the PED bit is managed. Note that when software writes this bit to a 1, it shall also write a 0 to the PR bit. This flag is 0 if PP is 0.
0	0h RW	**CCS:** Current Connect Status (CCS) ROS. Default = 0. 1 = A device is connected to the port. 0 = A device is not connected. This value reflects the current state of the port, and may not correspond directly to the event that caused the Connect Status Change (CSC) bit to be set to 1. Refer to sections 4.19.3 and 4.19.4 for more details on the Connect Status Change (CSC) assertion conditions. This flag is 0 if PP is 0.

31:2	0h RO	**RSVD29:** reserved
1	0h RW	**IE:** Interrupt Enable (IE) RW. Default = 0. This flag specifies whether the Interrupter is capable of generating an interrupt. When this bit and the IP bit are set (1), the Interrupter shall generate an interrupt when the Interrupter Moderation Counter reaches 0. If this bit is 0, then the Interrupter is prohibited from generating interrupts.
0	0h RW	**IP:** Interrupt Pending (IP) - RW1C. Default = 0. This flag represents the current state of the Interrupter. If IP = 1, an interrupt is pending for this Interrupter. A 0 value indicates that no interrupt is pending for the Interrupter. Refer to section 4.17.5 of XHCI specification for the conditions that modify the state of this flag.

3.74.27 IMOD—Offset 464h

Interrupter Moderation Register. Software may use this register to pace (or even out) the delivery of interrupts to the host CPU. This register provides a guaranteed inter-interrupt delay between interrupts asserted by the xHC, regardless of USB traffic conditions. To independently validate configuration settings, software may use the following algorithm to convert the inter-interrupt Interval value to the common 'interrupts/sec' performance metric:

Bit Range	Default & Access	Description
31:16	0h RW	**IMODC:** Interrupt Moderation Counter (IMODC) - RW. Default = undefined. Down counter. Loaded with the IMODI value whenever IP is cleared to '0', counts down to '0', and stops. The associated interrupt shall be signaled whenever this counter is '0', the Event Ring is not empty, the IE and IP flags = '1', and EHB = '0'. This counter may be directly written by software at any time to alter the interrupt rate.
15:0	fa0h RW	**IMODI:** Interrupt Moderation Interval (IMODI) - RW. Default = '4000' (~1ms). Minimum inter-interrupt interval. The interval is specified in 250ns increments. A value of '0' disables interrupt throttling logic and interrupts shall be generated immediately if IP = '0', EHB = '0', and the Event Ring is not empty.

15:0	0h RW	**ERS_TABLE_SIZE:** Event Ring Segment Table Size RW. Default = 0. This field identifies the number of valid Event Ring Segment Table entries in the Event Ring Segment Table pointed to by the Event Ring Segment Table Base Address register. The maximum value supported by an xHC implementation for this register is defined by the ERST Max field in the HCSPARAMS2 register (5.3.4). For Secondary Interrupters: Writing a value of 0 to this field disables the Event Ring. Any events targeted at this Event Ring when it is disabled shall result in undefined behavior of the Event Ring. For the Primary Interrupter: Writing a value of 0 to this field shall result in undefined behavior of the Event Ring. The Primary Event Ring cannot be disabled.

This bit controls the endian mode for data accesses. 0: Little-endian (default) 1: Big-endian In big-endian mode, DMA access (both read and write) for packet data will utilize a Byte Invariant Big-Endian mode (see Section Little-Endian and Big-Endian in the DWC SuperSpeed USB 3.0 Controller User Guide). Note: Since AXI requires byteinvariant endianness, setting DescBigend and DatBigEnd to one causes an address invariant transform to be applied, which is not appropriate.See section 9.3 and 9.4 of the AMBA AXI Specification. Hence for an AXI master (DWC_USB3_MBUS_TYPE=1), this bit must be set to zero.

29	0h RO	**DCNRD:** Value After Reset: 0x1 Device Controller Not Ready: The bit indicates that the core is in the process of completing the state transitions after exiting from hibernation. Software must wait for this bit to be de-asserted to zero before processing DS TS.USBLnk
28	0h RW	**SRE:** Save/Restore Error (SRE) -RW1C. Default = '0'. If an error occurs during a Save or Restore operation this bit shall be set to '1'. This bit shall be cleared to '0' when a Save or Restore operation is initiated or when written with '1'. Refer to section 4.23.2 for more information. When this register is exposed by a Virtual Function (VF), the VMM determines the state of this bit as a function of the Save/Restore completion status for the selected VF. Refer to section 8 for more information.x

2	0h RW	**OTG_Version:** TBD
1	0h RW	**HNPCap:** RSP/HNP Capability: The terminology RSP is used when the core is operating in SS mode, and HNP is used when the core is operating in non-SS mode. The application uses this bit to control the DWC_usb3 core's RSP/HNP capabilities. n 1'b0: RSP/HNP capability is not enabled. n 1'b1: RSP/HNP capability is enabled. Note: This bit is writable only if RSP/HNP mode is specified for Mode of Operation in coreConsultant, that is when DWC_USB3_EN_OTG != 0 and DWC_USB3_MODE = DRD. If RSP/HNP mode is not specified, this bit is Read Only, and is set to 1'b0.
0	0h RW	**SRPCap:** SRP Capability: The application uses this bit to control the DWC_usb3 core's SRP capabilities. n 1'b0: SRP capability is not enabled. n 1'b1: SRP capability is enabled. If this bit is not set for B-device, it cannot request the connected A-device (host) to activate Vbus and start a session. If this bit is not set for A-device, it cannot detect the SRP from B-device (device) to activate Vbus and start a session. Note: This bit is writable only if OTG is enabled in coreConsultant (DWC_USB3_EN_OTG !=0). If OTG is not enabled, then this bit is Read Only and is set to 1'b0.

31:7	0h RO	**RSVD0:** reserved
6	1h RW	**PeriMode:** Peripheral Mode: Application uses this bit to program the core to work as a peripheral or as a host. n 1'b0: The OTG device acts as a host n 1'b1: The OTG device acts as a peripheral

Bit Range	Default & Access	Description
5	0h RW	**PrtPwrCtl:** Port Power Control: Application sets this bit to initiate Vbus drive when it is an A-device. The application should clear this bit only if it wants to switch off the Vbus to B-device. The core clears this bit in the following conditions: n Transition from any state to A-IDLE state defined in OTG2.0 state machine. n When AIDL_BDIS_TOUT occurs in A_SUSPEND n When A_WAIT_BCON_TOUT occurs in A_WAIT_BCON n Transition to any B- state defined in OTG2.0 state machine
4	0h RW	**HNPReq:** HNP Request: n 1'b0: No HNP request n 1'b1: HNP request The application sets this bit to initiate a HNP request to the connected USB host. The application clears this bit by writing a 1'b0 when either of the following is detected: n OEVT.OTGBDevBHostEndEvnt n OEVT.OTGBDevVBusChngEvnt
3	0h RW	**SesReq:** Session Request: n 1'b0: No session request n 1'b1: Session request The application sets this bit to initiate a session request on the USB. Writing 1'b1 to this field will trigger the core to send SRP (data line pulsing) on PHY interface. In the absence of OEVT.OTGBDevSessVldDetEvnt after a session request, the application must wait for at least TB_SRP_FAIL time (6 secs) before initiating another session request. This field returns 1'b0 when read.
2	0h RW	**TermSelDLPulse:** TermSel DLine Pulsing Selection: This bit selects utmi_termselect to drive data line pulse during SRP. n 1'b0: Data line pulsing using utmi_txvalid (default). n 1'b1: Data line pulsing using utmi_termsel.
1	0h RW	**DevSetHNPEn:** Device Set RSP/HNP Enable: n 1'b0: RSP/HNP is not enabled in the application n 1'b1: RSP/HNP is enabled in the application The application sets this bit in the following scenario: n In HS/FS mode, when it successfully receives a SetFeature.SetHNPEnable command from the connected USB host. n In SS mode, when it has sent a b3_ntf_hst_rel to the A-device, or the A-device has sent an a3_ntf_host_req. Note: The terminology RSP is used when the core is operating in SS mode, and HNP is used when the core is operating in non-SS mode.
0	0h RW	**HstSetHNPEn:** Host Set RSP/HNP Enable: n 1'b0: Host Set RSP/HNP is not enabled n 1'b1: Host Set RSP/HNP is enabled The application sets this bit in the following scenario: n In HS/FS mode, when it has successfully enabled HNP (using the SetFeature.SetHNPEnable command) from the connected device. n In SS mode, when it has successfully enabled b3_rsp_enable feature in RSP-capable Device using SetFeature command while operating as an A-Host, or when it has received a b3_ntf_hst_rel through SetFeature command while operating as A-peripheral. Note: The terminology RSP is used when the core is operating in SS mode, and HNP is used when the core is operating in non-SS mode.

Bit Range	Default & Access	Description
11	0h RO	**OTGBDevBHostEndEvnt:** Write Behavior: oneToClear B-Device B-Host End Event: Set in B-device Mode Only. This event is generated when B-device has completed its host role. Note: This bit is applicable for OTG 2.0 and OTG 3.0 modes of operation.
10	0h RO	**OTGBDevHNPChngEvnt:** Write Behavior: oneToClear B-Dev HNP Change Event: Set in B-Device Mode only. This event is generated when there is a Success or Failure of an HNP attempt. Note: This bit is applicable for OTG 2.0 and OTG 3.0 modes of operation.
9	0h RO	**OTGBDevSessVldDetEvnt:** Write Behavior: oneToClear Session Valid Detected Event: Set in B-device Mode Only. This event is asserted when there is a valid Vbus from A-device and B-device succeeds in starting a session. Note: This bit is applicable for OTG 2.0 and OTG 3.0 modes of operation.
8	0h RO	**OTGBDevVBUSChngEvnt:** Write Behavior: oneToClear Vbus Change Event: Set in B-device Mode Only. This event is asserted when the utmisrp_bvalid signal goes low (indicating the end of a session), or goes high. Note: This bit is applicable for OTG 2.0 and OTG 3.0 modes of operation.

2	0h RO	**HstNegSts:** Host Negotiation Status: The core updates this bit when any of the following bits is set: n OEVTEN.OTGADevHNPChngEvnt n OEVTEN.OTGBDevHNPChngEvnt This bit indicates Host Negotiation Success or Failure. n 1'b0: Host negotiation failure. In A-device, for HS/FS, this indicates an imminent end of session indication from the core. In B-device, for HS/LS, it indicates that the timer used to wait for an A-device to signal a connection (b_ase0_brst_tmout in OTG 2.0) timed out resulting in B-device staying as B-peripheral. n 1'b1: Host negotiation success. This indicates that the host negotiation was successful. Note: This bit is applicable only for OTG 2.0 mode of operation.
1	0h RO	**SesReqSts:** Session Request Status: The core updates this bit when OEVTEN.OTGBDevSessVldDetEvnt is set. o 1'b0: Session request due to Vbus. This indicates that the session started due to Vbus without SRP detection by A-host. o 1'b1: Session request due to SRP. This indicates that the session started as a result of successful SRP detection by A-host. Note: This bit is applicable for OTG 2.0 and OTG 3.0 modes of operation.
0	0h RO	**OEVTError:** Write Behavior: oneToClear OTG Event Error: There are no errors currently defined.

2	0h RO	**BSesVld:** Indicates the Device mode transceiver status. Indicates the Device mode transceiver status. The core updates this bit when OEVTEN.OTGBDevVBUSChngEvnt is set. 1b0: B-session is not valid 1b1: B-session is valid Note: This bit is applicable for OTG 2.0 and OTG 3.0 modes of operation.
1	0h RO	**ASesVld:** Indicates the Host mode transceiver status. 1b0: A-session is not valid 1b1: A-session is valid
0	1h RO	**ConIDSts:** Connector ID Status: Indicates the connector ID status n 1'b0: The DWC_usb3 core is in A-device mode n 1'b1: The DWC_usb3 core is in B-device mode Note: The reset value of this field depends on the power-on value of the IDDIG signal from the PHY.

3.74.269 ADPCFG—Offset CC20h

ADP Configuration Register

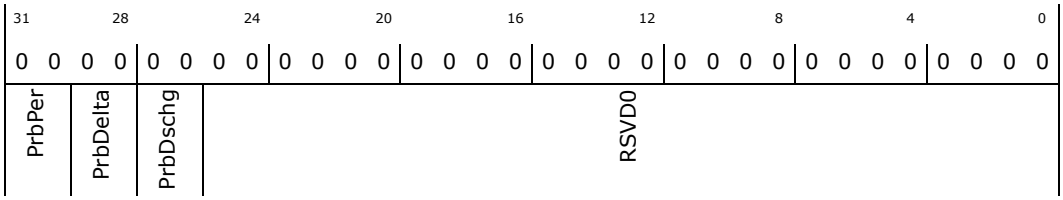
Access Method

Type: Memory Mapped I/O Register (Size: 32 bits)

ADPCFG: [BAR] + CC20h

BAR Type: PCI Configuration Register (Size: 32 bits)
BAR Reference: [B:0, D:22, F:0] + 10h

Default: 00000000h



Bit Range	Default & Access	Description
31:30	0h RW	**PrbPer:** Probe Period: These bits set the T_ADP_PRB as follows: n 2'b00: 0.775 sec n 2'b01: 1.55 sec n 2'b10: 2.275 sec n 2'b11: Reserved The scaledown values for PrbPer are: n 2'b00: 12.5ms n 2'b01: 18.75ms n 2'b10: 25 ms n 2'b11: 31.25 ms
29:28	0h RW	**PrbDelta:** Probe Delta: These bits set the resolution for RTIM value. They are defined in units of 32 kHz clock cycles as follows: n2'b00: 1 cycles n 2'b01: 2 cycles n 2'b10: 3 cycles n 2'b11: 4 cycles For example, if this value is chosen to be 2'b01, it means that RTIM increments for every two 32 kHz clock cycles.
27:26	0h RW	**PrbDschg:** Probe Discharge: These bits set the time for TADP_DSCHG. They are defined as follows: n 2'b00: 4 msec n 2'b01: 8 msec n 2'b10: 16 msec n 2'b11: 32 msec The scaledown values for the PrbDschg are as follows: n 2'b00: 62.5 us n 2'b01: 125 us n 2'b10: 250 us n 2'b11: 500 us

3.74.270 ADPCTL—Offset CC24h

ADP Control Register

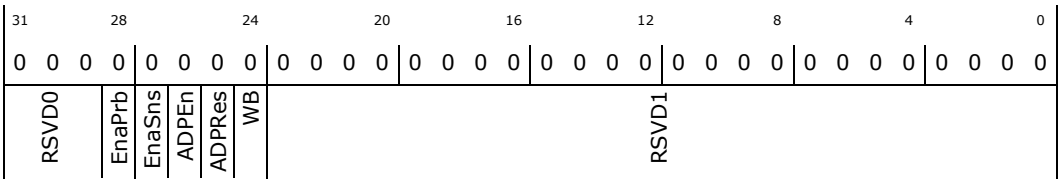
Access Method

Type: Memory Mapped I/O Register (Size: 32 bits)

ADPCTL: [BAR] + CC24h

BAR Type: PCI Configuration Register (Size: 32 bits)
BAR Reference: [B:0, D:22, F:0] + 10h

Default: 00000000h



Bit Range	Default & Access	Description
31:29	0h RO	**RSVD0:** reserved
28	0h RW	**EnaPrb:** Enable Probe: When set to 1'b1 along with ADPEn, the core performs a probe operation.
27	0h RW	**EnaSns:** ADP Enable: When set to 1'b1, the core performs either ADP probing or sensing based on EnaPrb and EnaSns. ADPEn = 1'b0 gates the suspend clock for major portion of ADP related logic.
26	0h RW	**ADPEn:** ADP Enable: When set to 1'b1, the core performs either ADP probing or sensing based on EnaPrb and EnaSns. ADPEn = 1'b0 gates the suspend clock for major portion of ADP related logic.
25	0h RW	**ADPRes:** ADP Reset: When set to 1'b1, the ADP controller is reset. This bit is auto-cleared after the reset procedure is complete in the ADP controller.
24	0b RO	**WB:** Write Busy: n 1'b0: Write Completed n 1'b1: Write in Progress The application can read or write ADPCFG and ADPCTL registers only if this field is cleared. Hardware sets this bit when the write is in progress in the Suspend clock domain.

ADP Event Register

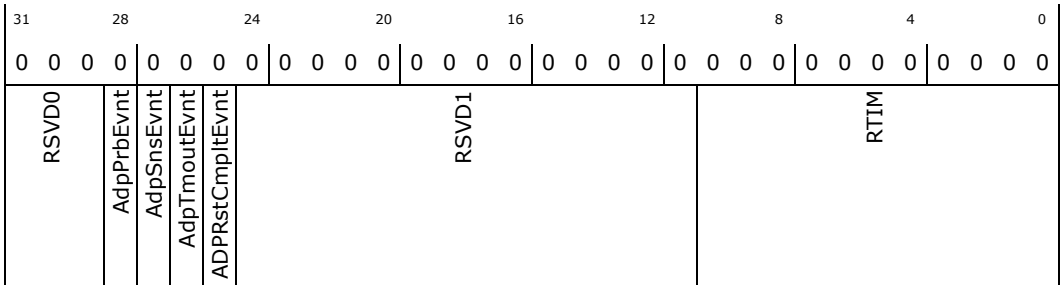
Access Method

Type: Memory Mapped I/O Register (Size: 32 bits)

ADPEVT: [BAR] + CC28h

BAR Type: PCI Configuration Register (Size: 32 bits)
BAR Reference: [B:0, D:22, F:0] + 10h

Default: 00000000h



Bit Range	Default & Access	Description
31:29	0h RO	**RSVD0:** Reserved
28	0h RO	**AdpPrbEvnt:** Write Behavior: oneToClear ADP Probe Event: When this event is set, it means that the Vbus voltage is greater than VadpPrb or VadpPrb is reached.
27	0h RO	**AdpSnsEvnt:** Write Behavior: oneToClear ADP Sense Event: When this event is set, it means that the Vbus voltage is greater than VadpSns or VadpSns is reached.
26	0h RO	**AdpTmoutEvnt:** Write Behavior: oneToClear ADP Timeout Event: This event is relevant when ADP probe command is executed. When this event is set, it means that the ramp time is completed (GADPCTL.RTIM has reached its terminal value of 0x7FF). This is a debug feature that allows software to read the ramp time after each cycle.
25	0h RO	**ADPRstCmpltEvnt:** Write Behavior: oneToClear This event, when set, indicates that the ADP Reset command is successful
24:11	0h RO	**RSVD1:** reserved
10:0	0h RO	**RTIM:** RAMP TIME: These bits capture the latest time it took for Vbus to ramp from VADP_SINK to VADP_PRB. The bits are defined in units of 32 kHz clock cycles as follows: n 0x000: 1 cycles n 0x001: 2 cycles n 0x002: 3 cycles and so on till, n 0x7FF: 2048 cycles A time of 1024 cycles at 32 kHz corresponds to a time of 32 msec. Note for scaledown ramp_timeout, n PrbDelta = 2'b00 =) 6250 us n PrbDelta = 2'b01 =) 3125 us n PrbDelta = 2'b10 =) 1562.5 us n PrbDelta = 2'b11 =) 781.25 us

3.75.1 reg_GEN_REGRW1_type (GEN_REGRW1)—Offset A0h

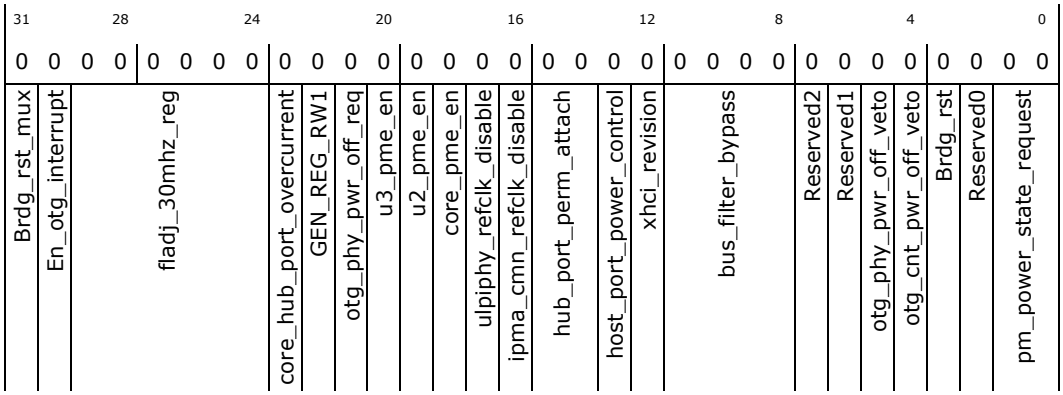
General Purpose Read Write Register1

Access Method

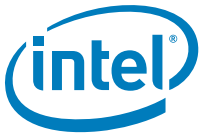
Type: PCI Configuration Register (Size: 32 bits)

GEN_REGRW1: [B:0, D:22, F:0] + A0h

Default: 00000000h



Bit Range	Default & Access	Description
31	0b RW	**Brdg_rst_mux:** This is a mux the core reset between the normal reset or reset and with bdg_reset regRW1[3]
30	0b RW	**En_otg_interrupt:** enable the OTG interrupt
29:24	000000b RW	**fladj_30mhz_reg:** HS jitter adjusment
23	0b RW	**core_hub_port_overcurrent:** This is a generic register provided for product specific behavior
22	0b RW	**GEN_REG_RW1:** This is a generic register provided for product specific behavior



Bit Range	Default & Access	Description
21	0b RW	**otg_phy_pwr_off_req:** Indicates that the PHY power (both core and suspend well) can be turned off. Valid for D0 and RTD3hot
20	0b RW	**u3_pme_en:** Determines whether USB3 flis PME events are allowed to trigger PME events to brige/GPIO
19	0b RW	**u2_pme_en:** Determines whether ULPI flis PME events are allowed to trigger PME events to brige/GPIO
18	0b RW	**core_pme_en:** Determines whether core PME events are allowed to trigger PME events to brige/GPIO
17	0b RW	**ulpiphy_refclk_disable:** Feeds logic that generates the 19.2MHz clkreq signal
16	0b RW	**ipma_cmn_refclk_disable:** Feeds through PIMA PHY into 25MHz clkreq signal
15:14	00b RW	**hub_port_perm_attach:** Indicates if the device attached to a downstream port is permanently attached or not
13	0b RW	**host_port_power_control:** This port defines the bit [3] of Capability Parameters (HCCPARAMS). Change the PPC value through the pin Port Power Control (PPC). This indicates whether the host controller implementation includes port power control. ? 0 - Indicates that the port does not have port power switches. ? 1 - Indicates that the port has port power switches.
12	0b RW	**xhci_revision:** This signal is used to select the xHCI revision that the host controller complies with
11:8	0000b RW	**bus_filter_bypass:** Bus Filter Bypass. Disables the internal bus filters that are enabled by DWC_USB3_EN_BUS_FILTERS coreConsultant parameter. This static signal is present only when DWC_USB3_EN_BUS_FILTERS is 1. It is expected that this signal is set or reset at power-on reset and is not changed during the normal operation of the core.
7	0b RW	**Reserved2:** reserved
6	0b RW	**Reserved1:** reserved
5	0b RW	**otg_phy_pwr_off_veto:** Indicates that PHY suspend power should not power off even on RTD3hot (Note that the PHY core power is turned off during RTD3hot in line with the OTG core, as a function of otg_cnt_pwr_off_veto)
4	0b RW	**otg_cnt_pwr_off_veto:** Indicates that controller power should not power off even on RTD3hot.Also a veto signal to keep LPPLL on. Note: Currently LPPLL results in a veto for S0iX flows
3	0b RW	**Brdg_rst:** reset the core see also regRW1[31]
2	0b RW	**Reserved0:** reserved
1:0	00b RW	**pm_power_state_request:** This port defines the PCI power management state requested by the software. When the core is configured with two power rail support (DWC_USB3_EN_PWROPT=2), the valid states are: ? 00: D0 ? 11: D3 Active State

3.75.2 reg_GEN_REGRW2_type (GEN_REGRW2)—Offset A4h

General Purpose Read Write Register2

Access Method

3.75.5 reg_GEN_INPUT_REG_type (GEN_INPUT_REGRW)—Offset C0h

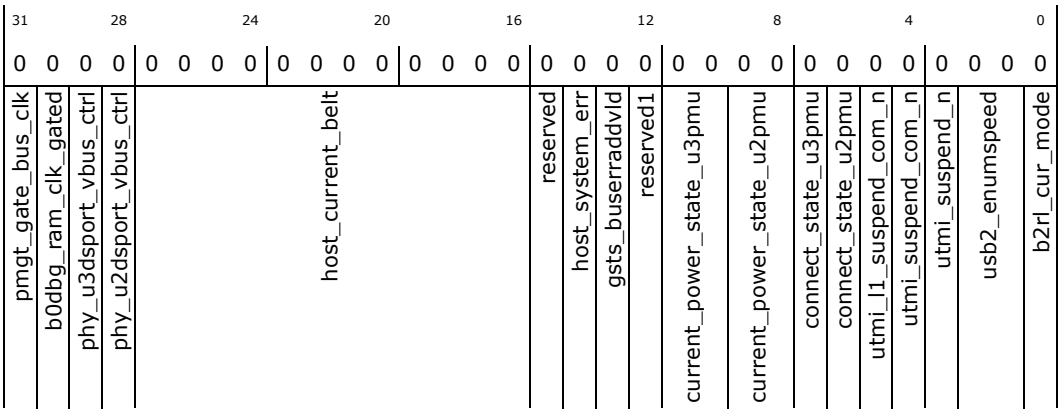
General Purpose Input Register

Access Method

Type: PCI Configuration Register (Size: 32 bits)

GEN_INPUT_REGRW: [B:0, D:22, F:0] + C0h

Default: 00000000h



Bit Range	Default & Access	Description
31	0b RO	**pmgt_gate_bus_clk:** Indicates that the conditions are appropriate for some internal modules to receive a gated bus_clk. This signal is used by the test environment to verify low power operation.

Bit Range	Default & Access	Description
30	0b RO	**b0dbg_ram_clk_gated:** Indicates that the internal ram_clk is being gated. It indicates whether ram_clk_gated is turned on or off. This signal is used by the test environment to verify low power
29	0b RO	**phy_u3dsport_vbus_ctrl:** When the PMU is in the D0 state, this PHY-side output is fed directly from the core without any intervening logic. The core-side input is called core_u3dsport_vbus_ctrl
28	0b RO	**phy_u2dsport_vbus_ctrl:** When the PMU is in the D0 state, this PHY-side output is fed directly from the core without any intervening logic. The core-side input is called core_u2dsport_vbus_ctrl
27:16	000h RO	**host_current_belt:** Current BELT Value. This signal indicates the minimum value of all received BELT values and the BELT that is set by the Set LTV command. This signal is valid only in Host mode.
15	0b RO	**reserved:** Reserved.
14	0b RO	**host_system_err:** Host System Error. Indicates that a Host System Error has occurred as reflected in the USBSTS.HSE field.
13	0b RO	**gsts_buserraddvld:** Bus error
12	0b RO	**reserved1:** Reserved.
11:10	00b RO	**current_power_state_u3pmu:** The current power state of the core. When equal to '3', the PMU is controlling the PHY, and when equal to '0', the core is controlling the PHY
9:8	00b RO	**current_power_state_u2pmu:** The current power state of the core. When equal to '3', the PMU is controlling the PHY, and when equal to '0', the core is controlling the PHY
7	0b RO	**connect_state_u3pmu:** When '1', indicates the PMU is maintaining at least one connection to the host or a device (the link is in U3). When '0', indicates the PMU has no connection to the host or any device.
6	0b RO	**connect_state_u2pmu:** When '1', indicates the PMU is maintaining at least one connection to the host or a device (the link is in L1, L2). When '0', indicates the PMU has no connection to the host or any device
5	0b RO	**utmi_l1_suspend_com_n:** Common L1 suspend
